In the claims:

For the Examiner's convenience, all pending claims are presented below with changes.

- 1. (Currently Amended) A computer system comprising:
 - a compressor/decompressor (codec);

a system module having one or more functions called by the codec to render compressed content; and

an integrity agent to enforce conditions of use for the received content by examining a first voucher describing the integrity of the codec and a second voucher describing the integrity of the one or more functions that are to be accessed by the codec, wherein the second voucher includes the system module critical content components to be used by the codec.

- 2. (Original) The computer system of claim 1 wherein the integrity agent decodes the received content prior to verifying the one or more functions.
- 3. (Previously Presented) The computer system of claim 1 wherein the system module comprises a first function to provide memory allocation for the codec.
- 4. (Previously Presented) The computer system of claim 1 wherein the integrity agent verifies the first voucher by comparing the first voucher to the codec.
- 5. (Previously Presented) The computer system of claim 1 wherein the integrity agent verifies the second voucher by comparing the second voucher to a first function of the system module.
- 6. (Original) The computer system of claim 1 further comprising a player application.

(Currently Amended) A trusted player comprising:
 a compressor/decompressor (codec); and

an integrity agent to enforce conditions of use for content received at the trusted player by examining a first voucher describing the integrity of the codec and a second voucher describing the integrity of one or more functions that are to be accessed by the codec, wherein the second voucher includes system module critical content components to be used by the codec.

- 8. (Original) The trusted player of claim 7 wherein the integrity agent decodes the received content prior to verifying the one or more functions.
- 9. (Original) The trusted player of claim 7 further comprising a system module, wherein the one or more functions utilized by the codec to assist in the decompression of received content codec are included within the system module.
- 10. (Previously Presented) The computer system of claim 7 wherein the integrity agent verifies the first voucher by comparing the first voucher to the codec.
- 11. (Previously Presented) The computer system of claim 7 wherein the integrity agent verifies the second voucher by comparing the second voucher to a first function of the system module.
- 12. (Original) The trusted player of claim 8 further comprising a player application.
- 13. (Currently Amended) A method comprising:
 receiving content at a compressor/decompressor (codec);
 calling a function of a first component of a system module from the codec to
 assist in decoding the digital content;

intercepting the function call to the first component of the system module at an integrity agent in order to enforce conditions of use of the content by examining a voucher describing the integrity of one or more functions that are to be accessed by the codec, wherein the voucher includes system module critical content components to be used by the codec; and

verifying the authenticity of the first component of the system module at the integrity agent by computing a digest of a memory image of the first component.

- 14. (Previously Presented) The method of claim 13 further comprising calling a function of a second component of a system module from the codec.
- 15. (Original) The method of claim 13 further comprising preventing the playback of the digital content if the first module is not authentic.
- 16. (Original) The method of claim 13 further comprising executing the function call to the first component of the system module if the first module is authentic.
- 17. (Original) The method of claim 16 further comprising:

 determining whether the codec is to call a function of a second component of the

system module to assist in decoding the content;

if so, intercepting the function call to the second component of the system module at the integrity agent; and

verifying the authenticity of the second component of the system module at the integrity agent.

18. (Original) The method of claim 17 further comprising playing the digital content if it is determined that the codec is not to call a function of a second component of the system module to assist in decoding the content.

- 19. (Original) The method of claim 16 further comprising:

 verifying the authenticity of the second component of the system module prior to

 calling the function of the first component of a system module; and

 preventing the playback of the digital content if the codec is not authentic.
- 20. (Currently Amended) An article of manufacture including one or more computer readable media that embody a program of instructions for verifying the authenticity of one or more functions utilized by a compressor/decompressor (codec) to assist in decoding the digital content, wherein the program of instructions, when executed by a processing unit, causes the processing unit to:

call a function of a first component of a system module from the codec; intercept the function call to the first component of the system module in order to enforce conditions of use of the content by examining a voucher describing the integrity of one or more functions that are to be accessed by the codec, wherein the voucher includes system module critical content components to be used by the codec; and

verify the authenticity of the first component of the system module at the integrity agent by computing a digest of a memory image of the first component.

- 21. (Previously Presented) The article of manufacture of claim 20 wherein the program of instructions, when executed by a processing unit, further causes the processing unit to call a function of a second component of a system module from the codec.
- 22. (Original) The article of manufacture of claim 20 wherein the program of instructions, when executed by a processing unit, further causes the processing unit to prevent the playback of the digital content if the first module is not authentic.

- 23. (Original) The method of claim 20 wherein the program of instructions, when executed by a processing unit, further causes the processing unit to execute the function call to the first component of the system module if the first module is authentic.
- 24. (Original) The method of claim 23 wherein the program of instructions, when executed by a processing unit, further causes the processing unit to:

determine whether the codec is to call a function of a second component of the system module to assist in decoding the content;

if so, intercept the function call to the second component of the system module; and

verify the authenticity of the second component of the system module.
